Writing the Code for the Class Fields

```
public class Rectangle
{
    private double length;
    private double width;
}
```

Access Specifiers

- An access specifier is a Java keyword that indicates how a field or method can be accessed.
- `public`
 - When the `public` access specifier is applied to a class member, the member can be accessed by code inside the class or outside.
- `private`
 - When the `private` access specifier is applied to a class member, the member cannot be accessed by code outside the class. The member can be accessed only by methods that are members of the same class.
