

1 If you want SAS for your own computer

SAS for Students, Windows version, is available at a reduced cost of \$45.00 for students using the software for academic purposes. This license needs to be renewed in October. Available at the IMU Bookstore. See the SAS Information page, <http://www.cs.its.uiowa.edu/software/sas.shtml> for product information.

2 Getting started in the TTC

TTC computers will display a login screen. Users should enter their HawkID and password in the spots provided. Students can find their HawkID and default passwords on the ISIS system.

3 Downloading files from the course web page

Bring up a web browser, either Firefox or Internet Explorer. Enter the address of my web page in the location box.

www.stat.uiowa.edu/~kcowles

Then click on "Course homepages" and "225:30/105."

Click on "Datasets," and when the next screen appears, click on the underlined link "Datasets." Three types of files may be accessed:

- Files ending in .dat are data files for your use with the software package SAS.
- Files ending in .info contain descriptive information about datasets.
- Files ending in .txt are datasets for use in a different class with a different software package.

Note that this list is case-sensitive, with all files with names beginning with capital letters appearing before all other files.

To download a data file for use in this lab:

- Right click the file name (use the right, not left, mouse button)
- In the dialog box that opens, left click "Save target as" (use the left mouse button)

- In the "save as" dialog box chose My Computer/Local Disk C:/ Temp. Click "Save."
- (If you preferred to save the file on your own disk in drive A: so that you could use it on a different computer later, you would move to drive A: in the dialog box before saving.)

Left click the "billion.info" file to read a description of the "billion" dataset. Click "Back" to get back to the list of datasets. Then download the file "billion.dat" according to the directions above.

4 Other useful features on the course web page

Return to the main course web page and click "Web resources." Note that there is a directory of the locations and hours of all the campus TTCs, as well as a link to the Mathematical Sciences Library electronic reserve (where solutions will be posted).

Lecture notes, homework assignments, and lab handouts are posted under "Handouts." These are in a format that may be read and printed in most TTCs.

5 Accessing SAS

Click on Start/All Programs/SAS/SAS 9.1 (English).

You will get a screen that shows:

- a menu bar
- a log window
- a program editor window

6 Entering commands and programs

Click in the program editor window. You may now type commands and programs in this window.

7 How SAS programs and commands are organized

Use a *DATA* step to organize your data by creating a SAS dataset. Then use *PROC* steps or automated features to analyze your data. Once you have created a SAS dataset, you may apply any SAS procedures or automated features to it during the SAS session without recreating the dataset.

DATA and *PROC* steps consist of SAS statements. Each statement must end with a semi-colon. Most statements include one or more keywords that must be spelled exactly as shown.

8 The DATA step: Creating a SAS dataset

Before it can process data, SAS must read in the data in the form of a table with

- a row for each observation
- a column for each variable

You must choose a name for the entire dataset and a name for each variable. SAS has the following rules for names:

- SAS names must begin with a letter or an underscore. The remaining characters in a SAS name can be letters, numbers, or underscores. There must be no embedded blanks.

SAS distinguishes between two types of variables: *numeric variables*, which contain only digits and decimal points and with which arithmetic operations may be done, and *character variables* (all other kinds of data).

9 Controlling print width

Put this line at the beginning of every SAS program if you want output to print correctly on 8-1/2 by 11 inch paper:

```
options linesize = 75 ;
```

10 Reading data in from an existing dataset

You have saved the file "billion.dat" in the "temp" directory. Use an "infile" statement to tell SAS to use it.

```
data billion ;           * gives dataset a name for SAS
infile 'c:\temp\billion.dat' ; * tells SAS where the data is
input with age region $ ; * names the variables in each row
                           * $ after region identifies character vbl
run ;                   * end of data step
```

Type these lines into the program editor window. To make SAS run these statements and create the dataset, use the mouse to highlight the block of statements and then click on the icon of the running man.

SAS will use the log window to tell you what it has done. Be sure to check the log window for any error messages. If any errors are reported, click in the program editor window to make it active. Correct the errors in the code and then rerun the block of code.

Note: if you wanted to read in the file from your own disk in the A: drive the infile statement would be:

```
infile 'a:billion.dat' ;
```

11 Using SAS procedures to list and tabulate the dataset

Once the dataset is created, you may run SAS procedures to analyze it. To list the entire dataset:

```
proc print data = billion ;
run ;
```

To get a frequency distribution of the regions in which billionaires lived:

```
proc freq data = billion ;
tables region ;           * tables is a keyword; region is the name of
                           * the variable for which you want counts ;
run ;
```

The output is:

The FREQ Procedure

region	Frequency	Percent	Cumulative Frequency	Cumulative Percent
A	38	16.31	38	16.31
E	80	34.33	118	50.64
M	22	9.44	140	60.09
O	29	12.45	169	72.53
U	64	27.47	233	100.00

12 Proc univariate: SAS workhorse of descriptive statistics

Use *proc univariate* for quantitative variables when you want the following:

- means
- medians
- quartiles
- 5-number summary
- stem plots (for small datasets) or histograms (large datasets)
- boxplots

```
proc univariate plot data = billion ;
var with ;
run ;
```

The output is:

The UNIVARIATE Procedure
Variable: w1ch
