Access Control Mechanisms

- Access Control Matrix
- Access Control List
- Capability based access control
- Lock and Key based access control.
- Rings-based access control

Access control with Locks and Keys

- Combines features of ACL's and capabilities.
- A piece of information (*lock*) associated with the object.
- Another piece of information (*key*) associated with subjects authorized to access the object.
- This can be dynamic
 - ACLs, C-Lists static and must be manually changed
 - Locks and keys can change based on system constraints, other factors (not necessarily manual).
