

15-441 Spring 06
Project 2: Network Layer

Mike Cui

Network Layer

- Gets data from host A to host B
 - Global addressing uniquely identifies A and B
 - Data finds its way to host B, directly or indirectly
 - Don't care how how they are connected, as long as they are.
- Where is host B, and how to get there?

Forwarding

- Finds host B by looking up in a forwarding table.
