

Artificial Intelligence Programming Neural Networks

Chris Brooks

Department of Computer Science
University of San Francisco

Neural networks

- Much of what we've studied so far can be classified as **symbolic AI**.
- Focus on symbols and relations between them.
 - Search, logic, decision trees, MDPs
- The underlying assumption is that manipulation of symbols is the key requirement for intelligent behavior.
- Neural networks focus on **subsymbolic** behavior.
- Intelligent behavior emerges from the interaction of simple components.

Department of Computer Science, University of San Francisco

Biology vs Computer Science

- In biological neurons, signals are received by dendrites and propagated to other neurons via the axon.
- Signaling and firing is very complex
- Thought and behavior are produced through the interaction of thousands of neurons.

Department of Computer Science, University of San Francisco

Biology vs Computer Science

- Computational neural networks are related to biological neural networks primarily by analogy
 - Computational neuroscience studies the modeling of biologically plausible neurons.
- AI researchers are often more interested in developing effective algorithms.
 - As with GAs, we draw upon ideas that are successful in nature and take the parts that are useful.

Department of Computer Science, University of San Francisco

Computational Neural Networks

- Neural networks are composed of nodes.
- These nodes are connected by links
 - Abstraction of axons
- Each link has an associated weight that indicates the strength of the signal.
- Each node has a nonlinear activation function
 - Governs node's output as a function of the weighted sum of its inputs.

Department of Computer Science, University of San Francisco

Appropriate tasks for neural learn

- Many attribute-value pairs.
- Real-valued inputs
- Real or discrete target value
- Noisy or error-containing data
- Long training time OK
- Fast evaluation of test cases needed
- Ability of humans to understand the learned hypothesis is not important.

Department of Computer Science, University of San Francisco

Computational Neural Networks

- 1. Bias unit is used to control the **threshold value**
 - 1. How strong the weighted input signal must be for the node to fire.

Downloaded from <https://www.coursera.org/learn/neural-networks>

Activation functions

- 1. Any nonlinear function can be used in principle.
- 2. Two most common functions are:
 - 1. Step function (threshold function) - Outputs 1 if input positive, zero otherwise.
 - 2. Sigmoid/logistic function: $\frac{1}{1+e^{-x}}$.
 - 1. Continuously differentiable
 - 2. Rapid change near threshold, gradual at extremes.

Downloaded from <https://www.coursera.org/learn/neural-networks>

Examples

- 1. Neural nets can easily be built to perform some standard logical operations using the threshold activation function.
- 2. Change the threshold depending on the function needed

Downloaded from <https://www.coursera.org/learn/neural-networks>

Types of nodes

- 1. We can distinguish between three types of nodes:
 - 1. Input nodes
 - 2. Output nodes
 - 3. Hidden nodes
- 2. We can also distinguish between types of networks
 - 1. Feed-forward networks: signals flow in one direction, no cycles.
 - 2. Recurrent networks: Cycles in signal propagation
- 3. We'll focus primarily on feedforward networks

Downloaded from <https://www.coursera.org/learn/neural-networks>

Function Approximators

- 1. Feedforward NNs fall into a family of algorithms called **nonlinear function approximators**
- 2. The output of a NN is a function of its inputs
- 3. Nonlinear activation function allows the representation of complex functions.
- 4. By adjusting weights, we change the function being represented
- 5. NNs are often used to efficiently approximate complex functions from data.

Downloaded from <https://www.coursera.org/learn/neural-networks>

Classification with Neural Networks

- 1. NNs also perform classification very well.
- 2. Map inputs into one or more outputs.
- 3. Output range is split into discrete "classes"
- 4. Very useful for learning tasks where "what to look for" is not known
 - 1. Face recognition, handwriting recognition, driving a car

Downloaded from <https://www.coursera.org/learn/neural-networks>

Perceptrons

- Single-layer networks (perceptrons) are the simplest form of NN.
- Easy to understand, but computationally limited.
- Each input unit is directly connected to one or more output units.

Downloaded from Study Drive on Wednesday, 20 October 2021

Perceptrons

- Output is thresholded weighted sum of the inputs.
- Threshold firing function used here.
- $a(x_1, \dots, x_n) = 1$ if $w_0 + w_1x_1 + w_2x_2 + \dots + w_nx_n > \theta$
- - 1 otherwise

Downloaded from Study Drive on Wednesday, 20 October 2021

Representational power of percept

- Output of net: $\sum_{j=0}^n W_j x_j > \theta$
- Perceptrons are capable of representing any linearly separable function.
- Unfortunately, many common functions (XOR, parity) are not linearly separable.
- In the early days of AI, perceptrons were popular, due to the fact that their weights could be easily learned.
