

Sophia D'Angelo and Emily Perretti

Causes: CO2

- The first image will be a dramatic and upsetting image depicting a primary cause of global warming
- This image would be pollution(CO2) emissions from a power plant into the air with faded images of animals in the background, representing the animals that will go extinct due to global warming and its effects

Causes: Deforestation

- Deforestation is another main cause of Global Warming
- 34 million acres of rainforest are cut down each year, which releases millions of tons of CO₂ into the atmosphere
- This picture will depict a large amount of land that has been destroyed and once again have faded, translucent animals, that once lived in those forests that are soon to go extinct because of their loss
