

Rank

Rank of an element is its position in ascending key order.

[2,6,7,8,10,15,18,20,25,30,35,40]

rank(2) = 0

rank(15) = 5

rank(20) = 7

Selection Problem

- Given n unsorted elements, determine the k 'th smallest element. That is, determine the element whose rank is $k-1$.
- Applications
 - Median score on a test.
 - $k = \text{ceil}(n/2)$.
 - Median salary of Computer Scientists.
 - Identify people whose salary is in the bottom 10%. First find salary at the 10% rank.

Selection By Sorting

- Sort the n elements.
- Pick up the element with desired rank.
- $O(n \log n)$ time.

Divide-And-Conquer Selection

- Small instance has $n \leq 1$. Selection is easy.
- When $n > 1$, select a **pivot** element from out of the n elements.
- Partition the n elements into 3 groups **left**, **middle** and **right** as is done in quick sort.
- The rank of the **pivot** is the location of the pivot following the partitioning.
- If $k-1 = \text{rank}(\text{pivot})$, **pivot** is the desired element.
- If $k-1 < \text{rank}(\text{pivot})$, determine the k 'th smallest element in **left**.
- If $k-1 > \text{rank}(\text{pivot})$, determine the $(k-\text{rank}(\text{pivot})-1)$ 'th smallest element in **right**.

D&C Selection Example

Find k th element of:

a

3	2	8	0	11	10	1	2	9	7	1
---	---	---	---	----	----	---	---	---	---	---

Use 3 as the pivot and partition.

a

1	2	1	0	2	3	10	11	9	7	8
---	---	---	---	---	---	----	----	---	---	---

$\text{rank}(\text{pivot}) = 5$. So **pivot** is the 6'th smallest element.

D&C Selection Example

a

1	2	1	0	2	3	10	11	9	7	8
---	---	---	---	---	---	----	----	---	---	---

- If $k = 6$ ($k-1 = \text{rank}(\text{pivot})$), **pivot** is the element we seek.
- If $k < 6$ ($k-1 < \text{rank}(\text{pivot})$), find k 'th smallest element in **left** partition.
- If $k > 6$ ($k-1 > \text{rank}(\text{pivot})$), find $(k - \text{rank}(\text{pivot}) - 1)$ 'th smallest element in **right** partition.
