Correction of example in lecture 15

```
A>>m2
```

```
....
```

```
A subclass: #B ... (not "B subclass: #A ...")
```

```
B>>m2
```

```
super m2
```

```
B subclass: #C...
```

```
C>>m1
```

```
self m2
```

```
aC := C new.
```

```
aC m1
```

What will happen if the lookup of m2 starts from the superclass of message receiver?

HW3

Array:

- reverse
- max
