

Based on Wienclaw (2009), describe three differences between the Internet and an intranet.

There are differences between the internet and intranet based on the information in Wienclaw's article . The internet would be considered a worldwide network that is non-private, and the intranet would be considered a private network protected by firewalls and supported by a company. The internet information is open to the public and the intranet is a site that usually belong to a company and contain information unauthorized by non-employees. The intranet would be connected usually a series of lan connections .But it also connected with a MAN connection to the internet, this usually serve as a backbone while the internet is a worldwide group of connected networks with public access. The business supports the intranet while the internet is all inclusive to all information.

## Response 2

The internet is a global network of individual computers. The maintenance of this system is dependant upon the service providers the individual users decide to use. The information typically is not private and often lacks a proper amount of protection from corruption.

The intranet is different from the internet in that it is typically on a secure and restricted network allowing employees to share files and other sensitive company information without the fear of a competitor or virus programmer attacking the system. This type of system is typically maintained by the companies' in house IT department.

The main differences between these two systems are that intranets are shared by people usually with a common interest for example their employers workplace whereas the internet is available for anyone's use. Intranets are protected by firewalls that prevent inappropriate usage where as with the internet anyone can cause damage to the system and it is basically up to the individual service providers to correct the issue. Finally there is a level of expected privacy of propriety and sensitive data when it comes to the intranet for the majority of the internet there is no such thing. The information on the internet is there for everyone's usage.
