

Reminders:

- Reading Chapter 10
- Homework #10 due today at 5 pm
- Inquire/Inform #2 due today in class
- Extra Credit #6 due Friday (In class)
- Exam #3 details will be given on Wednesday.
→ The exam is in class the Wednesday after break (Dec. 3)
- Deadline for changing research topics is this Friday.

Exam #3 Details...

The exam is in class on Wednesday, December 03, 2008.

The exam will be open textbook (R&K) and calculators are allowed. You will not be allowed to use other outside notes. Thus, make sure to bring the book and a calculator to the exam!

The exam will cover all of the material in Chapters 5, 6, 9, and 10 of the R&K text, homework assignments #8-10, and lecture material through and including Monday, December 1, 2008.

The exam problems will be similar to homework assignments, in class worked out problems, and issues discussed in the text or in lecture.

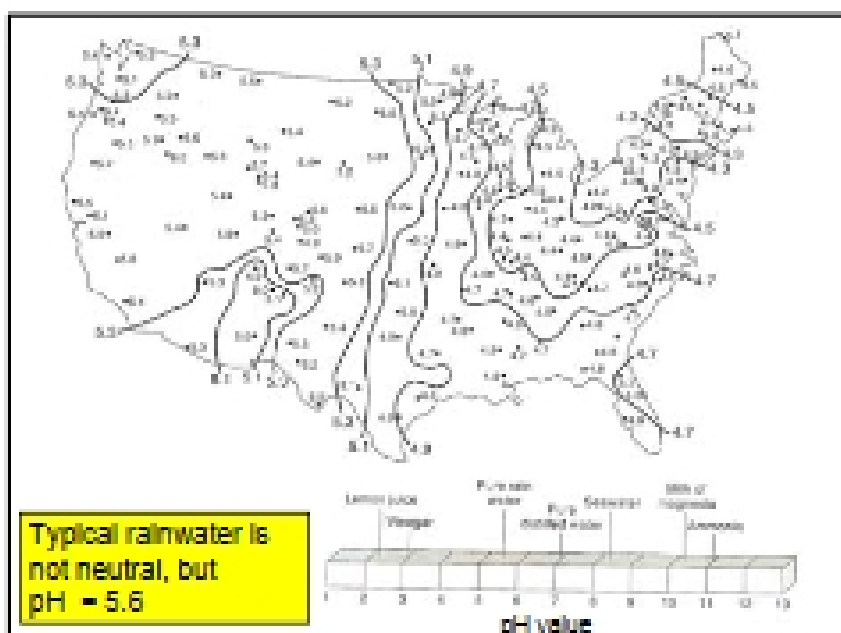

A practice exam (and solutions) are available on the web page.

Measure of Acidity

Each unit is factor of 10 in concentration

Acid Rain (Wet and Dry Deposition)

March 25, 2008

EPA's SO₂ auction results

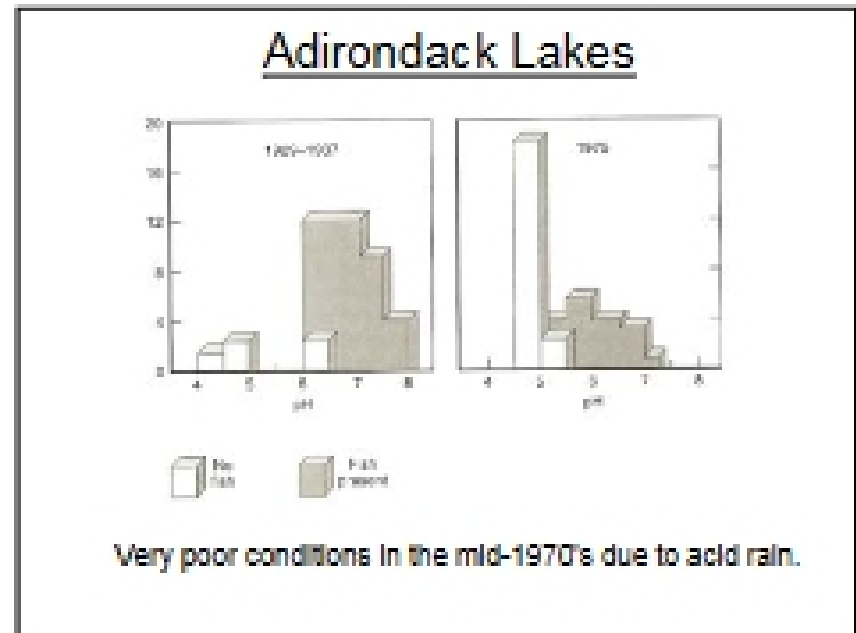

EPA Announces Results of the Substantially Auction 1 for the Domestic Carbon

(3/27/08) On March 25, 2008, EPA held the acid rain carbon giving private citizens, brokers and power plants the opportunity to buy and sell carbon dioxide (CO₂) allowances, as part of the cap and trade program to reduce acid rain. When fully implemented in 2018, the Acid Rain Program will have cut SO₂ emissions by 58 percent from 1998 levels. ...

The auction includes two types of allowances: 125,000 offered for use in 2008 and 125,000 additional allowances offered over years is advance to help provide stability in planning for capital investments. These advance allowances will be available for use in 2015. The number of allowances a source purchases will not permit them to emit SO₂ at a level that would violate the health-based national ambient air quality standard. The weighted average of winning bids for 2008 is \$209/ton.

12 of the 125,000 bids in the spot market were purchased by various groups (e.g., Andrus-Bellevue Fund, Bates College Environmental Resources) for the purpose of taking a tax of \$22 off the market.

1990 Acid Rain Program established under the Clean Air Act

Note that some measures are staged and thus only took effect later.

For SO₂, the program has a mandatory cap on emissions nationwide from electric utilities.

These are allocated in terms of allowances which can then be "banked for future use" or sold.

For NO_x, emission limits are placed for each source type.

Read the report carefully and let me know what you find "strange" or "inconsistent" in the scientific presentation...

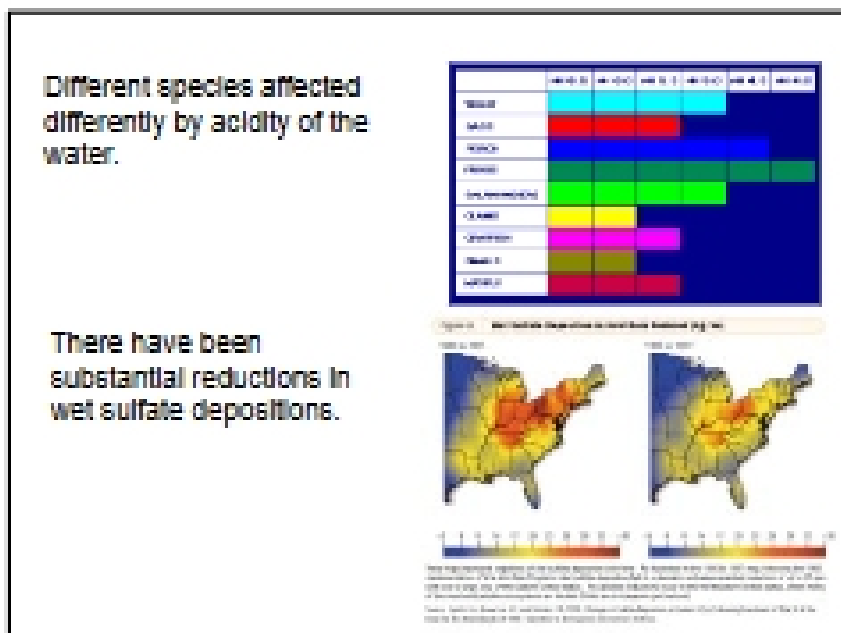

Clicker Question

Report highlights some real success in reducing SO₂.

How would you categorize this graph over the 10 year period?

Figure 3. Trend in Sulfur Dioxide Emissions for U.S. Principal Source Categories, 1987 to 1997

A) Not much change in SO₂ emission
B) An increase in SO₂ emission
C) A small decrease in SO₂ emissions
D) A decrease, punctuated by a significant decrease in 1995
E) None of the above

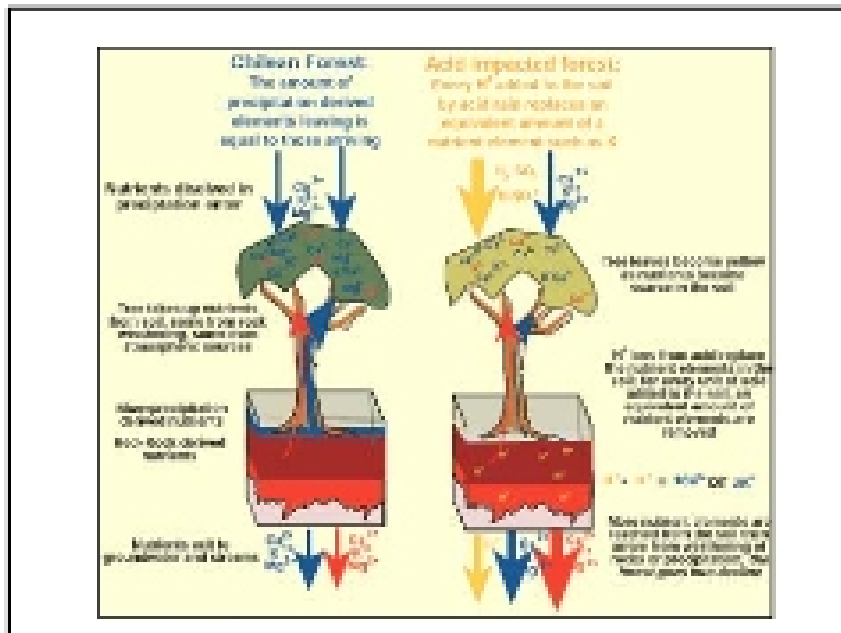

Adirondacks: Still to Recover

In spite of declining emissions and even declining surface water sulfate concentrations in the Adirondacks, lakes in this region are not showing any measurable increase in acid-neutralizing capacity. Why have other lakes in other wet-weather regions shown such a recovery? It's not clear.

Recovery of Adirondack surface waters may be affected by an increasing amount of deposition and presence of sulfate in water bodies. Even if wet's ability to neutralize sulfur is only "one carbon deposit", it could be enough to cause a significant increase in deposition, and heighten the potential for sulfate deposition and subsequent recovery.

Recent research and modeling offer a suggestion: although conditions would have been substantially worse without the Acid Rain Program, lake recovery in the Adirondacks may require additional sulfate and nitrogen inputs. These inputs, together with other sulfate and nitrogen inputs, may be necessary to restore the Adirondack lakes to their original state. This finding is consistent with other research that suggests that environmental monitoring programs are needed to assess the progress of lake recovery and to identify areas that need additional sulfate and nitrogen inputs.

"In spite of declining emissions and even declining surface water sulfate concentrations in the Adirondacks, lakes in this region are not showing any measurable increase in acid neutralizing capacity."

Particulates (Aerosols)

Particles smaller than about 100 μm (10⁻⁴ m)

Natural sources:
wind-blown dust, fog, ...

Produced during combustion of coal

Particles scatter light, but too small to see individually
